

FX2 v1.13 Firmware Update

ADDED FEATURES:

- All output processing and user Efx presets can be saved and loaded to/from a memory stick.
- Added ability to toggle between single song playback and continuous playback. (memory stick)
- Recording level adjustment – In the initial firmware, the record level was only adjustable in the “memory stick” screen. This level adjustment was actually applied to the memory stick signal and the signal being sent to the PC. We realize it would be nice to be able to adjust them independently, so we’ve added a second adjustment and made them unique to each signal, one adjustment for the memory stick and another for the PC.

BUG FIXES

- Some MP3’s were being recorded to the wrong folder on the memory stick. As of v1.10, all MP3’s are recorded to the root directory of the memory stick.
- In some cases the L/R signals were swapped in the USB transport. This has been fixed.
- While recording sequential files to the memory stick, the first file would record, but the subsequent files were empty.
- Improved accuracy of MP3 progress bar.
- Fixed MP3 decoder bug, certain ID3 tags were not being read properly, which resulted in distorted playback.
- Fixed LCD startup bug.
